

What is claimed is:

1. A vehicle body structure comprising:

a front side member extending in a longitudinal

5 direction of a vehicle body;

a side frame member provided rearwardly and laterally
of said front side member; and

a coupling member through which said front side member
is coupled to said side frame member,

10 wherein a coupled face including at least one ridge is
formed in a rear portion of said front side member;

a front portion of said coupling member is extended
along the coupled face; and

a coupling face including at least one ridge is formed
15 in the extended portion so as to be in face-contact with
and to be joined to the coupled face of said front side
member.

2. The vehicle body structure according to claim 1,
wherein the rear portion of said front side member is
20 joined to a dash panel of the vehicle body, the dash panel
being formed with a notch, and

said coupling member extends from said side frame
member through the notch, and is coupled to said front side
member.

25 3. The vehicle body structure according to claim 1,
wherein said front side member is formed to have a closed
cross-section, and

said coupling member is inserted into the closed
cross-section of said front side member.

30 4. The vehicle body structure according to claim 1,
wherein said front side member is formed by an outer panel
and an inner panel that are joined to each other,

said coupling member is formed into a U-shape in cross

section which opens to said outer panel, and is joined to the outer panel, and

said outer panel cooperates with said coupling member to form a closed cross-section.

5 5. The vehicle body structure according to claim 1, wherein the coupled face of said front side member has an upper face, an intermediate face, and a side face, a first ridge being formed between the upper face and the intermediate face and a second ridge being formed between
10 the intermediate face and the side face,

the coupling face of said coupling member has an upper face, an intermediate face, and a side face, a third ridge being formed between the upper face and the intermediate face and a fourth ridge being formed between the
15 intermediate face and the side face, and

the first ridge is continuous with the third ridge, and the second ridge is continuous with the fourth ridge.

6. The vehicle body structure according to claim 5, wherein the third and fourth ridges are joined into one on
20 a rear side of the vehicle body.

7. A vehicle body structure, comprising:

a dash panel provided at a front portion of the vehicle body;

a front side member extending in a longitudinal
25 direction of the vehicle body while forming a closed cross-sectional structure, and having a rear portion thereof joined to said dash panel;

a cross member extending along said dash panel in a width direction of the vehicle body, and having an end
30 portion thereof formed with a fixture face that is joined to the rear portion of said front side member;

a side frame member provided rearwardly and laterally of said front side member; and

a coupling member through which said front side member is coupled to said side frame member,

wherein a coupled face including at least one ridge is formed in the rear portion of said front side member;

5 a front portion of said coupling member is extended along the coupled face;

a coupling face including at least one ridge is formed in the extended portion; and

10 the coupling face is in face-contact with and joined to the coupled face of said front side member so as to overlap the fixture face of said cross member.

8. The vehicle body structure according to claim 7, wherein a notch is formed in said dash panel, and said coupling member extends from said side frame member through
15 the notch toward said front side member.

9. The vehicle body structure according to claim 7, wherein said cross member has left and right ends thereof that are curved forwardly, and a front end of the curved portion is joined to said front side member.

20 10. The vehicle body structure according to claim 7, wherein a flange extending upward is formed in a rear end of said front side member, and a flange extending upward is formed in an upper face of said cross member and is overlapped with and joined to the flange of said front side
25 member.

11. The vehicle body structure according to claim 7, wherein the coupled face of said front side member has an upper face, an intermediate face, and a side face, a first ridge being formed between the upper face and the
30 intermediate face and a second ridge being formed between the intermediate face and the side face;

the fixture face of said cross member has an upper face, an intermediate face, and a side face, a fifth ridge

being formed between the upper face and the intermediate face and a sixth ridge being formed between the intermediate face and the side face;

the first ridge is continuous with the fifth ridge,
5 and the second ridge is continuous with the sixth ridge.

12. The vehicle body structure according to claim 11, wherein the fifth and sixth ridges are joined into one on a rear side of the vehicle body.

13. The vehicle body structure according to claim 12,
10 wherein the coupling face of said coupling member has an upper face, an intermediate face, and a side face, a third ridge being formed between the upper face and the intermediate face, and a fourth ridge being formed between the intermediate face and the side face; and

15 the first and third ridges are continuous with the fifth ridge, and the second and fourth ridges are continuous with the sixth ridge.
